◆25th percentile ■50th percentile ▲75th percentile

Supplemental Material, Figure S1 Multivariable-adjusted quantile regression analysis of associations between **A**) maternal urinary cadmium (U-Cd; early pregnancy; log₂-transformed) and **B**) concurrent childhood U-Cd (log₂-transformed) with children's developmental measures (25th percentile: diamonds, 50th percentile: squares, and 75th percentile: triangles) at 5 years of age. Estimates with 95% CI represent the change in the values of the 25th, 50th and 75th percentiles of the outcome scores with a doubling of U-Cd exposure adjusted for age at testing, tester, sex, birth order, birth weight, HAZ (5 years), HOME, maternal BMI (early pregnancy), maternal IQ, SES, and maternal or concurrent urinary arsenic (log₂-transformed).

Supplemental Material, Table S1 Multivariable-adjusted linear regression analyses of cadmium exposure (maternal or concurrent urinary cadmium; log₂-transformed) and developmental outcomes at 5 years of age after additionally adjusting for arsenic or/and lead exposure (maternal or concurrent urine concentrations; log₂-transformed).
